INTRODUCING POLYSTATE

One state model.
Zero lock-in.

Write your state logic once — run it in React, Angular, or generate native Redux and NgRx code automatically.

Open Source | React 18+ | Angular 17+ | TypeScript Strict

THE PROBLEM

You're writing the same logic twice.

React team

Redux slices, RTK, selectors, thunks — all handwritten.

Angular team

NgRx actions, reducers, effects, facades — same logic, different code.

- Duplicate business logic across frameworks
- Same bugs fixed in two separate codebases
- Onboarding cost doubles for cross-framework contributors

THE SOLUTION

Define once.
Use anywhere.

⚡

Runtime Mode

Drop `@polystate/core` directly into React or Angular. No store setup, no providers — just hooks and services on top of a zero-dependency reactive core.

🛠️

Generate Mode

Run the CLI and get fully typed, idiomatic Redux + RTK (React) or NgRx (Angular) code. Your team keeps their workflow — you write the logic once.

WHY POLYSTATE?

Why not just Redux/NgRx?

❓ Share logic manually?

Copy-paste, version drift, maintenance nightmare.

📦 Monorepo?

Still two separate codebases, two build pipelines, two test suites.

✨ **One definition** — developers write logic once, never duplicate

🎯 **Framework choice** — use runtime OR generate native code

🚀 **Zero friction** — teams keep their existing patterns

REAL-WORLD EXAMPLE

Shared business logic across teams.

🌐 **Web App (React)**

Customer-facing dashboard with Redux + RTK.

🛠️ **Admin Panel (Angular)**

Internal tools with NgRx facade.

Define state logic **once**.

Generate both. Deploy separately.

No sync issues. No code duplication.

SEE IT IN ACTION

Define once, generate for both.

```
// store.definition.ts
export const todoDefinition = {
  name: 'todo',
  initialState: { todos: [] },
  actions: {
    addTodo: (state, title) => ({
      ...state,
      todos: [
        ...state.todos,
        { title, done: false }
      ]
    })
  }
}
```

```
# Generate native Redux
polystate generate \
  store.definition.ts --react

# Generate native NgRx
polystate generate \
  store.definition.ts --angular
```

Redux slice | RTK hooks | NgRx actions | Facade

Try it in 5 minutes.

7 packages · 0 core deps · 2 frameworks
